Model Export

HPL3 mainly uses Collada for importing models into the engine binary format, so this guide will only be about the Collada format (.dae). First of there will be some general information that concerns all 3d modelers. After that there will be some more specifics for the mayor packats

General

Setup

<u>Units</u>

Before doing any modelling, make sure that the units are properly set up. It is recommended that 1 unit equal 1 meter. It is also okay that 1 unit = 1 centimeter, but then a 1 meter high object needs to be 100 units high and so on. The engine will automatically adjust any data according to how the units are set up.

When working with animated objects the unit scale must be the same for the mesh and the animation. If they are different the animation will scaled incorrectly, causing the mesh to expand or shrink when animated.

Modelling

Setting Material

Always set the diffuse texture of the editor-material to have the same name as the engine-material (.mat) you want it to have. This is best accomplished by always letting the diffuse texture for the material have the same name as the engine-material (e.g. "dirt_road.dds" and "dirt_road.mat"). What happens when the model is loaded is that the engine checks the diffuse texture for the current submesh and then replaces the extention (eg ".dds", ".tga", etc) with ".mat" and then tries to load a material with that file name.

Note: When using the modelviewer, it will automatically create the ".mat"-file if one does not exist, and thus an engine-material does not need to be created by hand if the names of the texture are set up as described here.

Multiple Materials

In order to have a mesh with multiple material you must have several submeshes (or whatever the name of discrete objects in the editor) each with its own material and with different names of the diffuse texture. For example say you are making a character that requires a two materials, one for the hair and one for the body. You then first need to make sure that the hair and body are separate submeshes, then give each one their own material. The body's material can then have the diffuse map: "character_body.dds" and the hair's material can have "character_hair.dss". The engine will now use two different materials to load this character.

Note that this is the only way to go about! It is not possible to have polygon-IDs or whatever tricks the editor might have. One submesh can only have one material!

Setup

Collada exporter settings

Here is how the export tool should be set up:

ieneral Options			
File type:	OpenCOLLADA exporter 👻		
	Default file extensions		
leference Options			
	Preserve references		
	Keep only a reference		
	Vise namespaces		
Prefix with:	the file name 👻		
nclude Options			
	Include these inputs:		
	History		
	Channels Expressions		
	E Constraints		
	E Include texture info		
ile Type Specific Optic			
 General export optic 			
	Bake transforms		
	Relative paths	E	Copy textures
	Triangulate		
	Cgtx file references		
	C Sampling		
	Curve constrain		Static curve removal
 Filter export 			State Care renorm
	Export 🔽 Polygon meshes		Liahts
	Cameras		Joints and skin
	Animations		
	Invisible nodes	Г	Default cameras
	-		
	 Texture coordinates Normals 		Normals per vertex
	Vertex colors		Vormals per venex Venex colors per vertex
	Texture tangents		Geometric tangents
			and the second second
	Referenced materials only	Г	Materials only
 XRef options 	Export references	P 1	Dereference
Camera options			
	Export camera as lookat		
	T XFov		r'Fav
If neit	herXFov and YFov are selected, YFov	is expo	ned
 Precision options 			
	Export double precision		<i>x</i> .
	recision is selected, the maximum numb be printed is increased from 7 to 17 sig		
ugas a	see printed is interested from 7 to 17 alg		angen.
Export Selection	Apply		Close
	or large v	_	

Modelling

Material fails to export

If the model gets exported without any material check if any of this helps:

1) Check so that "intitialshadingGroup" has not been connected to the model. If it has been, then simple set the same material to the model again and the problem will go away.

2) Check so that two materials have not been set on the same mesh. For having a mesh with multiply material see General/Modelling/Multiple Materials

Animation

Modelling

Animation

Modo

Modelling

Mesh Setup

Every submesh in the scene need to have its own mesh layer and material for the texture and properties to be exported correctly.

3/3

<u>Triangulate</u>

The export tool does not triangulate the mesh autoatically so before exporting, you must enter geometry/polygon/triple in order for everything to be triangulated.

Animation

Blender

Modelling

Triangulate

Currently you have to triangulate the model before it can be exported, there is no export only triangulate.
