

# URL Protocol

An URL protocol is a way to link to a application from a webpage. We have support for this in both Depth and the ModelViewer. It can be used to give links to entities or map positions when giving feedback.

## Installation

Download the .bat file and place it in depth/redist/ folder and run it. This will link the protocol to the correct directory and files.

## ModelViewer

To link directly to a mesh or entity you can use the following URL:

modelview:filename.ent

The supported file types are .dae, .ent and some .dae\_anim files.

## Depth

To link to a map file you can use the following syntax
