

DDS Texture Export

Overview

Here it will be explained how to set up an entity with a translucent material. There is a lot of different techniques and programs that can be used to make the images used in this tutorial, so the focus will be mainly on using the engine's tools.

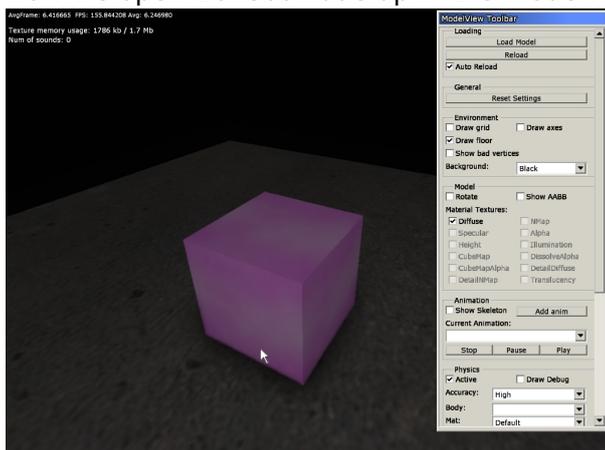

Steps

1) Setting up the model.

First of all the model needs to be set up and have a diffuse texture set to it (more info [here](#)). The file we have are:

- transbox.dae
- transbox.dds

Now we open transbox.dae up in the modelviewer and will see:

- The files we have are now:
- transbox.dae
 - transbox.dds
 - transbox.mat
 - transbox.msh

the ".mat"-file is generated by the modelviewer and is a solid material based upon the name of the diffuse texture (here "transbox"). Modelviewer can add further texture such as normalmaps, specular, etc if the files have the proper prefixes (for a list of those see [here](#)).

The "msh"-file is a binary version of the dae file that is much faster to load. No need to worry about that one in this tutorial.

2) Changing to translucent.
